LoopingCV

Evidence-based job search.
Applications you review and approve.

Public URL created | Account setup pending

Student name: _____
Register number / Department: _____

Reduce repetitive job-search work

Keep the user in control of facts, eligibility and every outgoing application.

PROBLEM

Current difficulties

Searching many job sites manually
Re-entering résumé information
Writing generic application messages
Tracking responses across different tools

OBJECTIVE

LoopingCV approach

Upload once and review evidence
Save India / remote search loops
Rank actual public listings
Approve exact messages and track status

Design principle: uncertainty becomes a review task.

From résumé to reviewed application

Discovery can run on a schedule; sending requires a user's explicit approval.

01

Upload résumé

Read PDF, DOCX or TXT

02

Review profile

Confirm facts and preferences

03

Create a loop

Choose sources, region and limits

04

Discover and rank

Actual listings; explainable scores

05

Verify and approve

Employer contact, eligibility and PDF

06

Track applications

Dispatch state and confirmed updates

ATS applications currently open the official employer page for manual completion.

A private workspace with external integrations

Python + Streamlit + SQLAlchemy + PostgreSQL + per-user Google OAuth.

USER

Streamlit interface

Google sign-in
Résumé and loop screens
Review and tracking

PYTHON

Workflow engine

Literal extraction and scoring
Verification and exact approval
Quota / duplicate checks

STORAGE

Private PostgreSQL

Tenant-separated records
Original résumé and drafts
Encrypted Gmail connection

Public feeds: Himalayas / Remotive / Greenhouse / Lever

External scheduler: discovery only | Gmail API: individually approved emails

Explainable keyword matching

A transparent scoring baseline. No trained language model or LLM API is required.

50%

Skill overlap

Compare recognized skills in the résumé and job text.

32%

Keyword overlap

Compare normalized job and résumé words.

18%

Title overlap

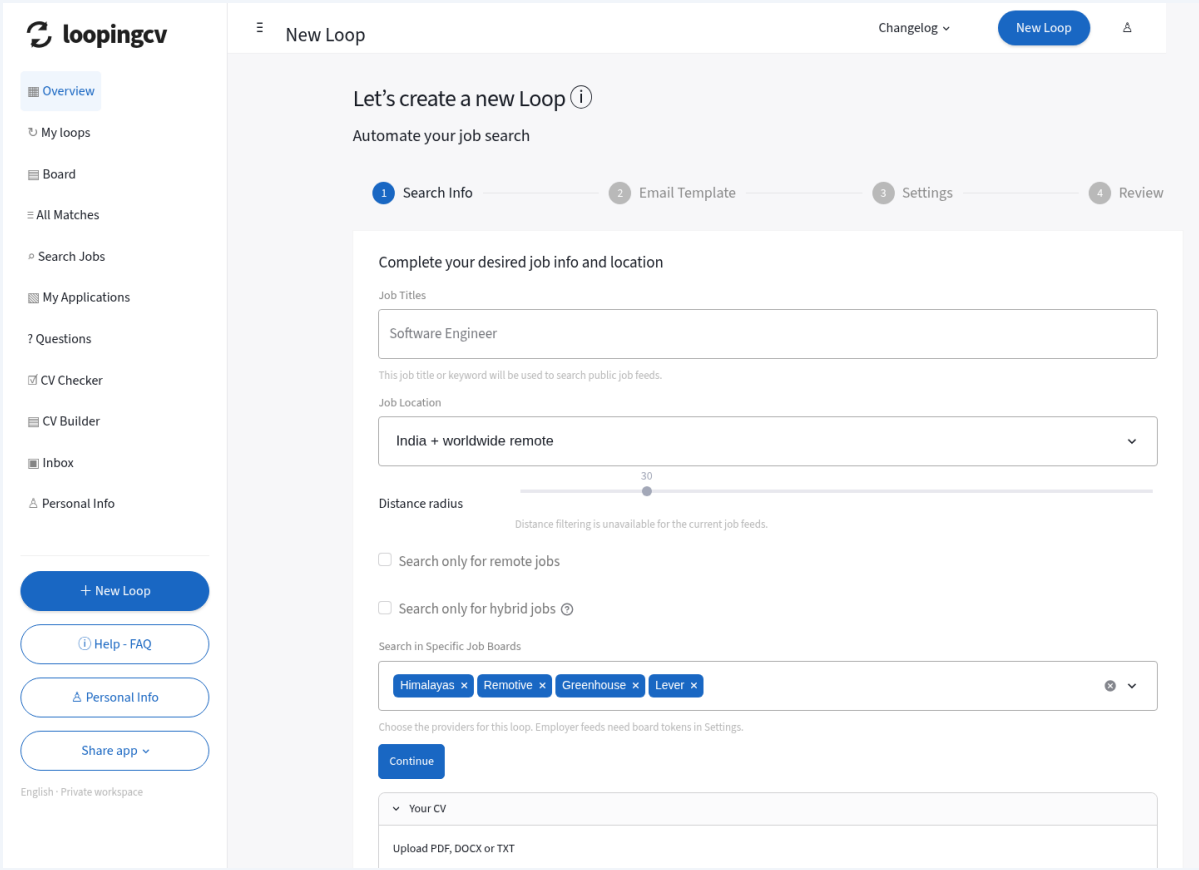

Compare the role title against résumé terms.

Output: matched skills, missing skills, shared keywords and a similarity score.

Eligibility, work authorization and mandatory requirements still need human verification.

LoopingCV dashboard

The actual local interface: a four-step search-loop wizard and private navigation.

One place to work

CV Checker
New Loop
Search Jobs / All Matches
My Applications
Board and CSV export
Share app

Screenshot: local preview

Safeguards around each outgoing email

Approval is checked against the recipient, subject, message and original PDF.

Exact approval

A message/PDF fingerprint must match the saved draft.

Private accounts

Records and Gmail credentials are scoped to each user.

Daily attempt limits

Database locks protect per-user quota reservations.

Duplicate protection

An already-attempted application cannot be resent.

Uncertain delivery

Timeouts require reconciliation in Gmail Sent.

Credential protection

Verified database TLS and encrypted OAuth tokens.

32 automated checks passed

Validated on 11 October 2026, including a real temporary PostgreSQL database.

32

passed
0 failed
0 skipped

Confirmed fixes

DOCX table contents are included.
Accented “résumé” no longer invents an R skill.
Missing or conflicting locations remain uncertain.
Degree dates are not treated as work experience.
Null optional job text does not crash matching.

Tests verify software behavior; they are not a model-accuracy score.

Implemented behavior and remaining work

The capstone scope separates working code from configuration and future integrations.

Résumé / loops / discovery / matching	Implemented
Exact draft approval / tracking / CSV	Implemented
Per-user Gmail sending	Built; OAuth setup + live delivery test pending
Scheduled discovery	Built; Actions secret + default-branch setup
Public URL / WhatsApp app sharing	URL created; private configuration pending
Automatic ATS forms / inbox replies	Not implemented; manual confirmation today
OCR / trained semantic model	Not implemented

No submission or employer response is claimed without a confirmed action.

Finish configuring the public app

Streamlit Community Cloud hosts the app; Google and PostgreSQL enable private use.

STEP 1

App URL created

Repository: automated-ai-
Branch:
codex/approval-gated-streamlit
File: streamlit_app.py
Python: 3.12

STEP 2

Configure secrets

Managed PostgreSQL
Google Web OAuth + Gmail API
Cookie and encryption keys
Actual app callback URLs

STEP 3

Validate and share

Two private test accounts
Reviewed résumé and draft
User-approved test email
Share app → WhatsApp

Public app: https://5dasesqq5hdkocoz5dupwp.streamlit.app/

The app currently shows setup. Add private secrets before inviting demo users.

A short, reproducible demonstration

Demonstrate the actual state; use clearly labeled demo data when presenting.

1. Upload a readable résumé and review the extracted evidence.
2. Create an India / remote loop with a reviewed template and limits.
3. Discover real vacancies and inspect matched / missing skills.
4. Verify mandatory criteria and the employer-published contact.
5. Review the exact draft and original PDF before any approval.
6. Inspect Board, export CSV and share the configured public link.

Local demo: no real email sends. Hosted integration demo: explicit approval + Gmail Sent check.

A reliable baseline for further development

Complete external configuration first, then evaluate each new integration.

FUTURE WORK

Evaluate matching

Build a labeled résumé/job dataset.
Measure ranking quality and errors.
Compare a semantic model with the keyword baseline.

FUTURE WORK

Add ATS adapters

Choose a supported provider API.
Obtain authorized integration access.
Keep review, consent and truthful status.

FUTURE WORK

Extend tracking

Add consented inbox read access.
Classify real replies conservatively.
Improve monitoring and worker scale.

Today: explainable discovery, private review and approval safeguards.
